

Faroe Shetlands - UK

FSB MegaSurvey

The definitive regional dataset for the Faroe Shetland Basin

The total full-fold area of coverage is greater than 26,431 sq. km and comprises more than 30 original 3D surveys (including cross-median line data from the Faroese sector).

The benefit of regional, fully migrated 3D data is the ability to obtain an improved and consistent regional geological perspective by tying wells to a common 3D data set plus the ability to obtain a regional interpretation and to identify prospects, plays and migration paths

Building on years of survey merging experience, PGS has developed a unique processing flow that combines and merges 3D surveys of differing vintages and quality into a coherent seamless dataset.

SURVEY SUMMARY

Type: MegaSurvey

Size: 26 431 km

Alternate ID: FSB MegaSurvey
